ABSTRACT

This study aim to find out the effect of fathering toward self-determination in adolescent 10th grade in Public Senior High School 3 Malang. Respondents in this study amounted to 108 people with 54 boys and 54 girls. The research method used quantitative methods with an open questionnaire. The sampling technique used purposive sampling techniques. The criteria of respondents is only child who lived with their biological father and mother were being sampled in this study. The scale of fathering compiled by researcher and self-determination scale adapted from the scale of Basic Psychological Needs Scale from Deci & Ryan.

The result showed that most of respondents had a high level of self determination, and the level of fathering is also high. The other results is fathering affects the self-determination with a value of p = 0.000 and the value of R= 0.37. The results also found that father's role as a caregiver affect the sense of autonomy with the value of p = 0.008, the father's role as a consultant and advisor (advocate) affect the sense of competencies (competence) with the value of p = 0.04, and the father’s role as social and academic resources (resource) affect the sense of relatedness adolescents with the value of p = 0.008. The other discovery is the role of father in girls and boys is no different.
