Faculty of Psychology, Islam State University of Maulana Malik Ibrahim Malang. Advisor: Dra. Siti Mahmudah, M.Si.

---

Keywords: *Self Efficacy*, Procrastination

This paper is used as prerequisite for the student to obtain the degree. Many students are usually busy with activities at their organization or even their job. They sometimes want to relax and therefore, they do procrastination. Final paper that must be finished in eight semesters may be delayed for the next semester. The phenomenon of procrastination is obvious among the psychology students at Islam State University of Maulana Malik Ibrahim Malang. have shown that 100 students from Class 2007 and Class 2008 are not yet be granted. Procrastination represents a barrier for students in accomplishing their final paper. The successful accomplishment of the final paper, moreover, needs *self efficacy* which is a mediator between what have been thought and the behavior of students in achieving what they want.

The objective of research is to understand *self efficacy* rate and procrastination rate and to acknowledge the relationship of *self efficacy* and procrastination in the writing of final paper among the psychology students of at Islam State University of Maulana Malik Ibrahim Malang.

Method of research is quantitative. The subject of research is 43 students of Class 2009 of Faculty of Psychology at Islam State University of Maulana Malik Ibrahim Malang who are doing their final paper. Data are collected , especially with scale. The data analysis tool is correlation analysis supported with SPSS version 16.0 for Windows.

Result of research indicates that *self efficacy* rate of the psychology students at Islam State University of Maulana Malik Ibrahim Malang remains in the moderate category at percentage of 51 % or 21 university student. The procrastination rate of the writing of final paper among the psychology students at Islam State University of Maulana Malik Ibrahim Malang is in the moderate category with percentage of 60,5 % or 26 university student. Result of correlation analysis of Product Moment shows that the relationship between *self efficacy* and procrastination is  $-0.718$  with  $p = 0.000$ . It means that the relationship of both is significantly negative. If the *self efficacy* rate is high, then the procrastination is low, and so the reverse, if the *self efficacy* rate is low, then the procrastination is high.
