The purpose of this study was to design a system of accounting information that can help employees clinics in the clinical information system development process on Daqu Clinic Healthy Malang . This study uses qualitative analysis with the method of observation , interviews and documentation .

An organization or company to plan, coordinate , control all activities to be able to supply a variety of important information about the activities , information systems play a role in generating information about transactions carried out by an organization . Accounting Information Systems (AIS) produce information aimed at external users (investors , creditors , customers , suppliers , shareholders and employees) and internal (line managers) as well as a key component in the decision -making process . One is the clinic which is a service organization , produces an output in the form of health care services . To carry out its activities effectively and efficiently , a clinic requires a data processing system that supports information

.In the research found many flaws in the system that had been used in Daqu Health Clinic . These weaknesses include the duties and authority that held the double in one section or division , lack of adequate documents and forms , as well as journal entries not in accordance with SAK .

Therefore, the researchers recommend the draft SIA consisting of organizational structure recommendations and job description , approximate code , narrative and flowchart procedures , standard journals , as well as the forms needed in the design of the system .Concluded with the information system , is expected to meet the information needs of the Clinic Healthy Daqu Malang .
