Keywords: Locus of control, prosocial behavior

Human beings are created for each other mutual assistance among themselves. In human life tend to have the nature of mutual assistance and the environment depends on how the family form of the trait. As a student in his daily activities on campus and the surrounding environment of mutual helping behavior will occur, one of the factors that influence prosocial behavior is the locus of control, where there are two orientations, namely internal locus of control orientation and external locus of control orientation. The purpose of this study was to determine the level of locus of control on the psychology faculty students of the State Islamic University of Malang Maulana Malik Ibrahim, to determine the level of prosocial behavior in school psychology students of the State Islamic University of Malang Maulana Malik Ibrahim, and to determine the relationship between locus of control with the behavior psychology faculty on student prosocial State Islamic University Malang Maulana Malik Ibrahim.

Locus of control is a determinant of one's beliefs about the source of his behavior, which has two orientations, namely locus of control internal and external locus of control, whereas prosocial behavior was an act done to help others.

This research is correlational quantitative correlation by using multiple regression analysis techniques (multiple regression analysis) to examine the relationship between locus of control internal and external to prosocial behavior. Previous to categorize locus of control carried out by looking at its z score, while the categorization of prosocial behavior using the mean and SD. Sampling techniques using purposive sampling. The subject is a student of the psychology department of the State Islamic University of Malang Maulana Malik Ibrahim Force 2008-2010 by taking 15% of the 524 existing populations in order to obtain the number of 77 students.

The results indicate the orientation of locus of control on the psychology faculty students of the State Islamic University of Malang Maulana Malik Ibrahim, there were 13 people 17% on internal locus of control orientation and 12 were 16% in external locus of control orientation, while the other 52 could not be classified. While the prosocial behavior of students in the high category 39 of 50.65%, the category was 48.05%, and 37 people on a low category of 1.3%. The analysis showed a significant relationship exists between locus of control with prosocial behavior that is $rx_1 = .633$ sig = .000 and $rx_2 = .861$ sig = .000. of these results we can conclude that there is a relationship between locus of control orientation of the internal and external to prosocial behavior in school psychology student UIN Malang Maliki.
