Keyword: Type Personality (Extroverts and Introverts), Significance of Life (Meaning Of Life)

Everyone is always different in the desire, motivation, goals, ideals, values of life, needs, and reason. Similarly, Psychology student UIN Malang Maulana Malik Ibrahim has goals, ideals, and values are different, because psychology students have the personality type that is different. Personality types are divided menjadi2, extroverted personality types and introvert personality type.

This study aimed to: (1) to determine the level of meaningfulness of life (meaning of life) at the Faculty of Psychology Students (2) to determine the type of personality (extrovert and introvert) Faculty of Psychology (3) to determine the relationship between personality types (extroverts and introverts ) with the meaningfulness of life (meaning of life) students of the Faculty of Psychology.

The research was conducted in 2008-2011 with a psychology student generation using quantitative correlation study design. The samples taken 15% of 652 students to 99 students. Sampling using a purposive sampling with the following criteria: Mahasiswa Force 2008-2011, was active in college, and is in early adulthood between 18-25 tahun. Retrieval of data using a test and attitude scale meaningfulness of life. On data processing use of Pearson Product Moment Correlation, and test the validity and reliability using Cronbach Alpha. Processing the data was processed with SPSS 16.0 for Windows.

The results showed that the dominant personality types in psychology students are extroverted personality type as much as 86 students (86.87%) and introverted personality type as many as 13 students (13.13%). While on the meaningfulness of life variables obtained results that the meaningfulness of life of students are in high category is the category of 80.8% have a percentage of 18.2%, and low categories of 1%. On the results of data analysis, showed that there was no relationship between personality types (extroverts and introverts) with the meaningfulness of life. because the value of the correlation ( $r_{xy}$ ) is positive 0.187. With the acquisition count = 0.064  $p > 0.05$ , indicating that the relationship that occurs is not significant.
