Key words: Aggressive behavior, Coping strategies

Coping strategy is an attempt by individuals both cognitively and behavior in order to cope with the demands of internal and external which is considered as a challenge or problem for the individual. Divided into two coping strategies: problem focused of coping (coping strategies oriented to the problems) and emotional focused of coping (coping strategies oriented emotion). Aggressive behavior is the behavior of individuals who intended to injure or harm another individual who does not want the arrival of such behavior, aggressive behavior can be physical or verbal. Lately there are many street children aged adolescents who show aggressive behavior, either physical or verbal, this is caused from street life is hard and wild. In this case researchers are interested in doing research on the differences in aggressive behavior by adolescents coping strategies at TVC read street in Malang. With the aim to determine the level of aggressive behavior in adolescent street, street adolescents form coping strategies, and know the different behavior of aggression based on coping strategies in adolescent street.

This type of research is quantitative research. With coping strategies as the X variable and aggressive behavior as a variable Y. The population in this study were adolescents Griya Read Malang street numbering 30 people, with a sample of 30 adolescent street. Sampling by sampling the population. And supporting data in this study were obtained through interviews and observation. Measuring devices are used as data collection in this study is questionnaire. To test the validity of the items stated there are 18 valid in aggressive behavior and the second item disqualified, while coping strategies there are 23 valid items and 5 items disqualified. To test reliability in aggressive behavior by 0857, sedanfkan coping strategies for 0938.

By using the method of analysis the unpaired t test (independent samples t test) with SPSS release 15 for windows. Obtain results for the total score of aggressive behavior in adolescent street based coping strategies showed t count equal value - 2101 0045 with a significance value ($p < 0.05$), so that H_0 is rejected at a 5% error level, and it can be concluded that the differences `t terdapat total score of aggressive behavior in adolescent street children based coping strategies. This is shown in which the total score of aggressive behavior in problem focused coping strategies of coping with an average of 37.50 tend to be lower than the total score of aggressive behavior in coping with the emotional focused strategies of coping with an average of 44.72.
